

HAZMAT Inventory

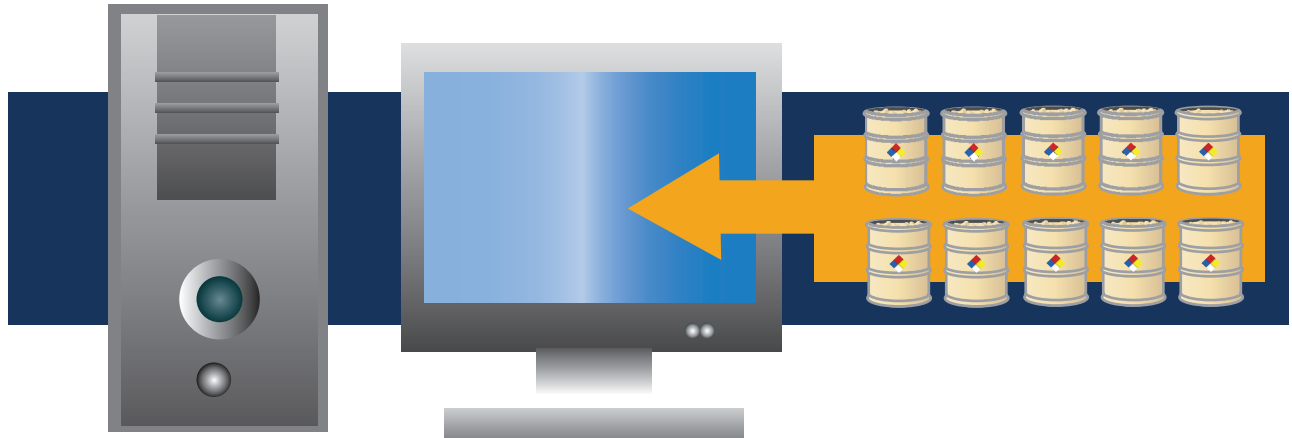

Our HazMat Inventory module allows you to easily keep track of plant inventories of hazardous materials within your facilities to stay in compliance with regulations.

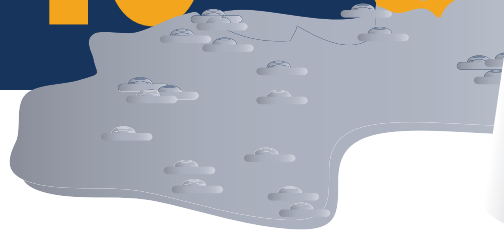

Typically, an EHS professional has to manually keep track of the various containers of materials at multiple buildings around a plant and compile time consuming reports.

HazMat Inventory works in conjunction with our time tested Online-MSDS material safety data sheet management system which allows for easy calculation of hazardous quantities. You would enter the original material and the size, such as ten drums of solvent.

10 = 8

The software will use the MSDS information to calculate the weight of the individual hazardous ingredients, such as ten drums of paint contain eight pounds of mercury.

All of these calculations are done on the fly using standard conversion tables and the specific gravity from the safety data sheet.

Once you enter the inventory amounts the system will be able to generate the information necessary to complete:

1 FORM • R **2** TIER • 1 **3** TIER • 2
4 CALIFORNIA **5** EMISSIONS
TITLE 19

What used to take a long time, will now take but **seconds** of your time.
